

## ① Control flow of Python program?

A sequence in which statements in Python source code are executed at the time of running is called as control flow of program.

## ② Why name control flow?

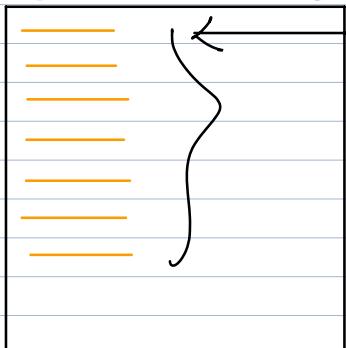

When any statement is being executed, its machine language translation is being executed by the processor.

When CPU is executing a statement in source code (technically CPU executes machine language translation of statement) then we say that the 'statement' has a control of 'CPU'

## ③

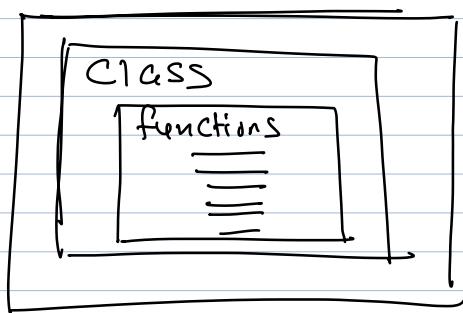

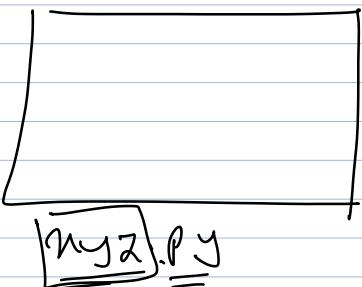

### Source Code

Sequence of statements  
at source code level.

By default, but not always,  
statements are executed  
in the same sequence as they

appear in the source code.
